

CC Commander — Agents & Model Tiers

v6.2.0 · 22 specialist agents · 4-tier ladder

"Pay for Fable on the thinking, not the typing."

1 • The Tier Ladder

TIER	MODEL	WHERE IT RUNS	USE FOR
 Deep mode	claude-fable-5	Escalated main thread via <code>/model claude-fable-5</code> ; fleet Conductor	Architecture, migration design, threat-model work, deep orchestration/synthesis
 Everyday default	claude-opus-4-8	Session default (main thread PM); fleet Leads	The baseline everything starts on — general dev, orchestration, complex implementation slices
 Workhorse	claude-sonnet-5	Delegated subagents by default; fleet Workers	Bulk implementation, standard feature work, tests, moderate refactors
 Bulk	claude-haiku-4-5	Hooks (format/status/doc-sync); simple lookups	Mechanical formatting, polish, linting, trivial single-file edits

Cost intuition: Fable $\approx 2\times$ Opus 4.8 per token (\$10/\$50 vs \$5/\$25 per MTok in/out) · Sonnet $\approx 0.6\times$ Opus · Haiku $\approx 0.2\times$ Opus. Fable is **escalated into**, not the default — a blanket Fable default taxes every trivial session at $2\times$. Opus 4.8 stays the everyday PM. Pay for Fable on the **thinking**, not the **typing**.

2 • All 22 Agents by Model Tier (verified from agents/*.md frontmatter)

AGENT	TIER	USE-CASE	AGENT	TIER	USE-CASE
architect	 Fable	System design, architectural trade-offs, tech selection	java-reviewer	 Sonnet	Java review — Spring patterns, NPE prevention
debugger	 Fable	Root-cause debugging (Iron Law: no fix without confirmed cause)	kotlin-reviewer	 Sonnet	Kotlin review — coroutines, Android, null safety
product-manager	 Fable	PRDs, user stories, roadmap/spec planning	performance-engineer	 Sonnet	Bottleneck/hot-path profiling, audit-only
security-auditor	 Fable	OWASP-mapped audits, CVE/CWE vulnerability discovery	python-reviewer	 Sonnet	Python review — PEP 8, type hints, async, pytest
builder	 Sonnet	Implements features/fixes from specs, TDD	qa-engineer	 Sonnet	Test suite creation, coverage-delta reports
content-strategist	 Sonnet	Content plans, blog/landing/email/social copy	researcher	 Sonnet	Competitive/market research, code audits, SEO
csharp-reviewer	 Sonnet	C#/.NET code review, async correctness	reviewer	 Sonnet	General code review — security, perf, correctness
data-analyst	 Sonnet	Data exploration, pipeline design, insight extraction	rust-reviewer	 Sonnet	Rust review — ownership, unsafe blocks, clippy
designer	 Sonnet	UI/UX design, accessible interface implementation	technical-writer	 Sonnet	API docs, READMEs, developer guides

devops-engineer	 Sonnet	CI/CD, infra, deploys, monitoring	typescript-reviewer	 Sonnet	TS review — type safety, async, ESM/CJS hygiene
fleet-worker	 Sonnet	Scoped parallel task execution for /ccc-fleet	18 of 22 agents run on Sonnet by default — the bulk-work workhorse tier.		
go-reviewer	 Sonnet	Go code review — idioms, races, channels			

3 • Escalation Rules

- **Main thread is fixed at session start** — Claude cannot silently hot-swap the running session's model. Escalate deep-reasoning work explicitly: `/model claude-fable-5` . Main thread stays Opus 4.8 until you escalate.
- **Subagents auto-route by complexity** — dispatcher picks Haiku → Sonnet → Opus → Fable per delegated task, silently, based on a reasoning-complexity score.
- **Never switch models mid-session** — spawn a subagent on the target model instead of changing the main thread's model repeatedly.
- **Fleet-scale work → /ccc-fleet** — 3-tier orchestration: **Fable conducts** **Opus leads** **Sonnet workers** , reserved for fleet/worktree-parallel work only.
